## Abstract

Nattokinase (NK) is one such thrombolytic enzyme. Nattokinase is an enzyme with strong fibrinolytic activity that can be used for preventing thrombolytic diseases. It is a serine protease class of enzyme. Nattokinase finds its application in medical industry widely. It provides health benefits like cure of Diabetes, Muscle spasms, poor healing, chronic inflammation, help improve blood clotting mechanism, improve blood circulation, blood viscosity. In the present study, fermented soya bean powder is used as substrate for nattokinase production and the optimized parameters like incubation time, inoculum volume, inoculum age and pH that effect the production are optimized and the crude enzyme obtained was purified by using liquid-liquid extraction technique.

**Key words:** Nattokinase, fibrinolytic activity, thrombolytic diseases, blood clot, soya bean powder, liquid-liquid extraction.
